FALLS CHURCH, VA 22040-0747			2626	
NOTIFICATION DATE		DELIVERY MODE		
04/01/2009		ELECTRONIC		

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Notice of the Office communication was sent electronically on above-indicated "Notification Date" to the following e-mail address(es):

mailroom@bskb.com

<b>Office Action Summary</b>	<b>Application No.</b> 10/587,514	<b>Applicant(s)</b> UCHIMOTO ET AL.
	<b>Examiner</b> JESSE S. PULLIAS	<b>Art Unit</b> 2626

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --  
**Period for Reply**

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
  - If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
  - Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED. (35 U.S.C. § 133).
- Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(o).

#### Status

- 1) Responsive to communication(s) filed on 13 March 2009.
- 2a) This action is FINAL.      2b) This action is non-final.
- 3) Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

#### Disposition of Claims

- 4) Claim(s) 1-18 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) Claim(s) \_\_\_\_\_ is/are allowed.
- 6) Claim(s) 1-18 is/are rejected.
- 7) Claim(s) \_\_\_\_\_ is/are objected to.
- 8) Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

#### Application Papers

- 9) The specification is objected to by the Examiner.
- 10) The drawing(s) filed on \_\_\_\_\_ is/are: a) accepted or b) objected to by the Examiner.  
 Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
 Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

#### Priority under 35 U.S.C. § 119

- 12) Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) All    b) Some \* c) None of:  
 1. Certified copies of the priority documents have been received.  
 2. Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.  
 3. Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

#### Attachment(s)

- 1) Notice of References Cited (PTO-892)  
 2) Notice of Draftsperson's Patent Drawing Review (PTO-948)  
 3) Information Disclosure Statement(s) (PTO/SB/08e)  
 Paper No(s)/Mail Date \_\_\_\_\_
- 4) Interview Summary (PTO-413)  
 Paper No(s)/Mail Date \_\_\_\_\_
- 5) Notice of Informal Patent Application  
 6) Other: \_\_\_\_\_

#### **DETAILED ACTION**

1. This office action is in response to the after-final arguments filed 03/13/09 regarding application 10/587514. No claims were amended or cancelled, and claims 1-18 are pending in the application.

#### ***Response to Arguments***

2. Applicant's argument on page 6 regarding Wakita inputting entire sentences has been fully considered and is persuasive. Therefore, the rejection has been withdrawn. However, upon further consideration, a new ground(s) of rejection is made in view of a newly discovered reference to Chan et al. (6,604,101).

3. The remaining arguments regarding Wakita and Appleby on pages 6-9 of the remarks are not persuasive, for the following reasons:

In response to applicant's argument on page 6 that Wakita does not disclose including partial correspondence information indicating correspondence between a word/phrase in the source language and a word/phrase in the target language in each sentence pair, the examiner respectfully disagrees. Wakita explicitly states in [0014] "It is necessary for the interpreting apparatus of this embodiment to do the following before performing interpretation: .... *writing the correspondence between the keyword groups and the target language expression patterns* into the example DB 3".

In response to applicant's argument on page 6 that Wakita does not disclose storing in the form of a keyword related phrase table, a target language keyword-related phrase corresponding to each source-language keyword-related detected phrase, one cannot show nonobviousness by attacking references individually where the rejections

are based on combinations of references. See *In re Keller*, 642 F.2d 413, 208 USPQ 871 (CCPA 1981); *In re Merck & Co.*, 800 F.2d 1091, 231 USPQ 375 (Fed. Cir. 1986). Wakita discloses a keyword-related phrase storage step in which a target-language keyword-related phrase corresponding to each source-language keyword-related phrase is detected from the partial correspondence information of each sentence pair ([1026-8], keywords are combined to make phrases, which are found in the examples, also **Fig 5b**). Appleby discloses phrases are stored in the form of a keyword-related phrase table in a storage means (**Fig 19a**, [0176], and [0042-43] imply the use of tables stored in memory). It would have been obvious to one of ordinary skill in the art at the time of the invention to modify the invention of Wakita such that the phrases are stored in the form of a keyword-related phrase table in a storage means, as taught by Appleby, in order to require less examples for translation, since phrases are more general, as suggested by Appleby ([0011] [0005]). The outputted target language expression pattern of paragraph [0129] in Wakita, referenced on page 7 of the remarks, is simply the output example and is not done "instead" of any storage step.

In response to applicant's argument on page 7 that Wakita's text sentence candidate generation feature does not involve the claimed keyword-related phrases in the target language, one cannot show nonobviousness by attacking references individually where the rejections are based on combinations of references. Appleby discloses a text candidate generation means assumes dependency relationships among keyword-related phrases in the target language described in the keyword-related phrase table ([0169], [0171]). It would have been obvious to one of ordinary skill in the art at

the time of the invention to modify the invention of Wakita such that the phrases are stored in the form of a keyword-related phrase table in a storage means, and a text candidate generation means assumes dependency relationships among keyword-related phrases in the target language described in the keyword-related phrase table, as taught by Appleby, in order to require less examples for translation, since phrases are more general, as suggested by Appleby (**[0011] [0005]**).

In response to applicant's arguments on page 7 that in Appleby, the full text sentence in the source language has to be inputted, one cannot show nonobviousness by attacking references individually where the rejections are based on combinations of references. Chan discloses an input step in which one or more keywords in the source language are input via an input means without inputting a full text sentence in the source language (**Fig 2**, query input in source language 118). It would have been obvious to one of ordinary skill in the art at the time of the invention to modify the invention of Wakita and Appleby such that one or more keywords in the source language are input via an input means without inputting a full text sentence in the source language, in order to dialectally standardize the keyword or query input by the user to a more commonly known or used term, which would be distinctly helpful because standardizing the word to a commonly known word insures that the target language search engine will recognize it, as noted by Chan (**Col 4 lines 22-29**).

In response to applicant's arguments on page 8 that Appleby does not disclose creation of the claimed partial correspondence information of each sentence pair generated in the sentence pair extraction step, one cannot show nonobviousness by

attacking references individually where the rejections are based on combinations of references. a sentence pair extraction step in which a sentence pair extraction means extracts one or more sentence pairs each including at least one of the keywords from a parallel corpus database (**Fig 2a**) including partial correspondence information indicating correspondence between a word/phrase in the source language and a word/phrase in the target language in each sentence pair ([0119], key words are paired in the example DB3); a keyword-related phrase storage step in which a target-language keyword-related phrase corresponding to each source-language keyword-related phrase is detected from the partial correspondence information of each sentence pair ([1026-8], keywords are combined to make phrases, which are found in the examples, also **Fig 5b**); a text sentence candidate generation step (**Fig 1**, output sentence generating means 8) generates one or more target-language text sentence candidates (**Fig 8**, output sentence generating means 66); and an output step in which at least one text sentence candidate is output from an output means corresponding to the full text sentence in the source language (**Fig 8**, text output). Appleby discloses phrases are stored in the form of a keyword-related phrase table in a storage means (**Fig 19a**, [0176], and [0042-43] imply the use of tables stored in memory), and a text candidate generation means assumes dependency relationships among keyword-related phrases in the target language described in the keyword-related phrase table ([0169], [0171]). It would have been obvious to one of ordinary skill in the art at the time of the invention to modify the invention of Wakita such that the phrases are stored in the form of a keyword-related phrase table in a storage means, and a text candidate generation

means assumes dependency relationships among keyword-related phrases in the target language described in the keyword-related phrase table, as taught by Appleby, in order to require less examples for translation, since phrases are more general, as suggested by Appleby ([0011] [0005]).

***Claim Rejections - 35 USC § 103***

4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

5. Claims 1, 5-7, 8, and 12-14 are rejected under 35 U.S.C. 103(a) as being unpatentable over Wakita et al. (2002/0010573) in view of Appleby (2005/0171757), in further view of Chan et al. (6,604,101).

With respect to claims 1 and 8, Wakita discloses a method and apparatus for generating a text sentence in a target language different from a source language (**Abstract**), based on one or more words in the source language input as keywords (**Abstract**), the method comprising: an input step in which the one or more keywords in the source language are input via an input means (**Fig 1**, key word extracting means 5 extracts keywords which are input to sentence example selecting means 7), the one or more keywords being a segment of the full text sentence in the source sentence (**Fig 7**, input sentence and extracted keywords); a sentence pair extraction step in which a sentence pair extraction means extracts one or more sentence pairs each including at

least one of the keywords from a parallel corpus database (**Fig 2a**) including partial correspondence information indicating correspondence between a word/phrase in the source language and a word/phrase in the target language in each sentence pair ([0119], key words are paired in the example DB3); a keyword-related phrase storage step in which a target-language keyword-related phrase corresponding to each source-language keyword-related phrase is detected from the partial correspondence information of each sentence pair ([1026-8], keywords are combined to make phrases, which are found in the examples, also **Fig 5b**); a text sentence candidate generation step (**Fig 1**, output sentence generating means 8) generates one or more target-language text sentence candidates (**Fig 8**, output sentence generating means 66); and an output step in which at least one text sentence candidate is output from an output means corresponding to the full text sentence in the source language (**Fig 8**, text output).

Wakita does not specifically mention the phrases are stored in the form of a keyword-related phrase table in a storage means, and a text candidate generation means assumes dependency relationships among keyword-related phrases in the target language described in the keyword-related phrase table.

Appleby discloses phrases are stored in the form of a keyword-related phrase table in a storage means (**Fig 19a**, [0176], and [0042-43] imply the use of tables stored in memory), and a text candidate generation means assumes dependency relationships among keyword-related phrases in the target language described in the keyword-related phrase table ([0169], [0171]).

It would have been obvious to one of ordinary skill in the art at the time of the invention to modify the invention of Wakita such that the phrases are stored in the form of a keyword-related phrase table in a storage means, and a text candidate generation means assumes dependency relationships among keyword-related phrases in the target language described in the keyword-related phrase table, as taught by Appleby, in order to require less examples for translation, since phrases are more general, as suggested by Appleby (**[0011] [0005]**).

Wakita and Appleby do not specifically mention the one or more keywords in the source language are input via an input means without inputting a full text sentence in the source language.

Chan discloses an input step in which one or more keywords in the source language are input via an input means without inputting a full text sentence in the source language (**Fig 2, query input in source language 118**).

It would have been obvious to one of ordinary skill in the art at the time of the invention to modify the invention of Wakita such that one or more keywords in the source language are input via an input means without inputting a full text sentence in the source language, in order to dialectally standardize the keyword or query input by the user to a more commonly known or used term, which would be distinctly helpful because standardizing the word to a commonly known word insures that the target language search engine will recognize it, as noted by Chan (**Col 4 lines 22-29**).

With respect to claims 5 and 12, Wakita and Appleby disclose a text sentence is generated a target language by performing the sentence pair extraction step, the keyword-related phrase storage step, and the text sentence candidate generation step for each combination of source and target language; and in the output step, a text sentence candidate of one language is output (**See claim 1**).

Wakita and Appleby do not specifically mention two or more languages are output.

It would have been obvious to one of ordinary skill in the art at the time of the invention to use the invention of Wakita and Appleby to output two or more languages instead of one, since the translation device disclosed by Appleby may be viewed as a "base device" upon which outputting two languages instead of one may be viewed as an improvement; translation from one language to two or more was a known technique at the time of the invention; and one of ordinary skill in the art would have recognized that applying the known technique of translating into two or more languages would have predictably resulted in two or more output translations which would have improved the invention by making it useful to a multilingual audience.

With respect to claims 6 and 13, Wakita discloses a text sentence candidate generation step (**Fig 1**, output sentence generating means 8) (**Fig 7**) generates one or more target-language text sentence candidates (**Fig 8**, output sentence generating means 66).

Wakita does not specifically mention the text candidate generation means assumes dependency relationships among keyword-related phrases in the target language described in the keyword-related phrase table, and a source-language text candidate generation means assumes dependency relationships among keyword-related phrases in the source language described in the keyword-related phrase table and generates one or more source-language text sentence candidate, and in the output step, at least one set of text sentences in the source and target languages is output from the output means.

Appleby discloses a text candidate generation means assumes dependency relationships among keyword-related phrases in the target language described in the keyword-related phrase table ([0045] target dependency structure D), and a source-language text candidate generation means assumes dependency relationships among keyword-related phrases in the source language described in the keyword-related phrase table and generates one or more source-language text sentence candidate ([0045] target dependency structure C), and in an output step, at least one set of text sentences in the source and target languages is output from the output means (Fig 6).

It would have been obvious to one of ordinary skill in the art at the time of the invention to modify the invention of Wakita such that the text candidate generation means assumes dependency relationships among keyword-related phrases in the target language described in the keyword-related phrase table, and a source-language text candidate generation means assumes dependency relationships among keyword-related phrases in the source language described in the keyword-related phrase table

and generates one or more source-language text sentence candidate for reasons similar to those of claim 1. It would have been further obvious to modify the invention such that in the output step, at least one set of text sentences in the source and target languages is output from the output means, in order to allow the user to confirm the correct sentence in the source language has been translated.

With respect to claim 7 and 14, Wakita does not, but Appleby discloses after the text sentence candidate generation step, an evaluation step in which an evaluation means evaluates each text sentence candidate ([0169], translation units are evaluated to find a matching structure), wherein in the output step, at least one text sentence candidate is selected based on the evaluation and the selected text sentence candidate is output ([0170], the target surface structure determined from dependency structure and used to generate target sentence text [0171]).

It would have been obvious to one of ordinary skill in the art at the time of the invention to modify the invention of Wakita such that after the text sentence candidate generation step, an evaluation step in which an evaluation means evaluates each text sentence candidate, wherein in the output step, at least one text sentence candidate is selected based on the evaluation and the selected text sentence candidate is output, in order to make the output sentence more resistant to errors caused by ambiguous grammar, as suggested by Wakita ([0021]).

Art Unit: 2626

6. Claims 2 and 9 are rejected under 35 U.S.C. 103(a) as being unpatentable over Wakita et al. (2002/0010573) in view of Appleby (2005/0171757), further view of Chan et al. (6,604,101), in further view of Fukumochi et al. (5,321,607).

With respect to claims 2 and 9, Wakita discloses after the sentence pair extraction step, one of the several competing translations is selected (**Fig 1**, sentence example selecting means selects one of examples from example database 3).

Wakita does not specifically mention discloses a keyword-related phrase storage step in which a target-language keyword-related phrase corresponding to each source-language keyword-related phrase is detected from the partial correspondence information of each sentence pair and stored in the form of a keyword-related phrase table in a storage means wherein a keyword-related phrase in the target language corresponding to the selected keyword-related phrase in the source language is described in the keyword-related phrase table.

Appleby discloses a keyword-related phrase storage step in which a target-language keyword-related phrase corresponding to each source-language keyword-related phrase is detected from the partial correspondence information of each sentence pair and stored in the form of a keyword-related phrase table in a storage means wherein a keyword-related phrase in the target language corresponding to the selected keyword-related phrase in the source language is described in the keyword-related phrase table (**Fig 19a** show translation components which are stored with correspondence information between the source and target language phrases, see also [0176]).

It would have been obvious to one of ordinary skill in the art at the time of the invention to modify the invention of Wakita such that a keyword-related phrase storage step in which a target-language keyword-related phrase corresponding to each source-language keyword-related phrase is detected from the partial correspondence information of each sentence pair and stored in the form of a keyword-related phrase table in a storage means wherein a keyword-related phrase in the target language corresponding to the selected keyword-related phrase in the source language is described in the keyword-related phrase table, for reasons similar to those of claim 1.

Wakita, Appleby, and Chan do not specifically mention if, in the sentence pair extraction step, two or more sentence pairs are extracted for a keyword input in the input step and if two or more different keyword-related phrases in the source language are detected from the partial correspondence information, then the detected two or more keyword-related phrases in the source language are presented to a user such that the user is allowed to select a keyword-related phrase from the presented two or more keyword-related phrases.

Fukumochi discloses a keyword-related (**Col 6 lines 31-34**, sentence is segmented into each morpheme string) phrase presentation step in which if, in the sentence pair extraction step, two or more sentence pairs are extracted for a keyword input in the input step (**Col 6 lines 58-59**, plurality of subtrees are extracted due to ambiguity, and **Col 7 lines 50-57**, each subtree is transformed to target language and sentence produced for each one) and if two or more different keyword-related phrases in the source language are detected from the ambiguity (**see above**), then the detected

two or more keyword-related phrases in the source language are presented to a user such that the user is allowed to select a keyword-related phrase from the presented two or more keyword-related phrases (**Col 9 lines 63-67**, partial translated sentence candidates are generate and the user is allowed to select one).

It would have been obvious to one of ordinary skill in the art at the time of the invention to modify the invention of Wakita, Appleby, and Chan by including a keyword-related phrase presentation step in which if, in the sentence pair extraction step, two or more sentence pairs are extracted for a keyword input in the input step and if two or more different keyword-related phrases in the source language are detected from the partial correspondence information, then the detected two or more keyword-related phrases in the source language are presented to a user such that the user is allowed to select a keyword-related phrase from the presented two or more keyword-related phrases, wherein in the keyword-related phrase storage step, if the user selects a keyword-related phrase from the presented two or more keyword-related phrases, a keyword-related phrase in the target language corresponding to the selected keyword-related phrase in the source language is described in the keyword-related phrase table as taught by Fukumochi, in order to resolve disadvantages associated with ambiguity in an input sentence, as suggested by Fukumochi (**Col 1 lines 32-37**).

7. Claims 4 and 11 are rejected under 35 U.S.C. 103(a) as being unpatentable over Wakita et al. (2002/0010573) in view of Appleby (2005/0171757), further view of Chan et al. (6,604,101), in further view of Tolin et al. (5,490,061).

With respect to claims 4 and 11, Wakita, Appleby, and Chan do not specifically mention in the sentence pair extraction step, at the beginning of the step, one or more morphemes are added to or subtracted from a keyword input in the input step or a keyword input in the input step is replaced with a similar word.

Tolin discloses one or more morphemes are added to or subtracted from a keyword input in the input step or a keyword input in the input step is replaced with a similar word (**Abstract**, words are subjected to morphological word stripping, which replaces with the root word which is similar since it has the same meaning).

It would have been obvious to one of ordinary skill in the art at the time of the invention to modify the invention of Wakita and Appleby by in the sentence pair extraction step, at the beginning of the step, one or more morphemes are added to or subtracted from a keyword input in the input step or a keyword input in the input step is replaced with a similar word as taught by Tolin, in order to reduce database size by only having to store root words in a dictionary, as suggested by Tolin (**Title and Abstract**).

8. Claims 3, 10, and 15-18 are rejected under 35 U.S.C. 103(a) as being unpatentable over Wakita et al. (2002/0010573) in view of Appleby (2005/0171757) further view of Chan et al. (6,604,101), in further view of Fukumochi et al. (5,321,607), in further view of Sata et al. (5,608,623).

With respect to claims 3 and 10, Wakita does not, but Appleby discloses each time one keyword is input in the input step, the sentence pair extraction step and the keyword-related phrase storage step are performed ([0171], target text generation is

done by recursively traversing a target surface structure to extract the target text from the target surface head and daughter components, see also claim 1).

It would have been obvious to one of ordinary skill in the art at the time of the invention to modify the invention of Wakita such that each time one keyword is input in the input step, the sentence pair extraction step and the keyword-related phrase storage step are performed, in order to provide continuous translation.

Wakita, Appleby, and Chan do not specifically mention a keyword-related phrase presentation step in which if, in the sentence pair extraction step, two or more sentence pairs are extracted for a keyword input in the input step and if two or more different keyword-related phrases in the source language are detected from the ambiguity then the detected two or more keyword-related phrases in the source language are presented to a user such that the user is allowed to select a keyword-related phrase from the presented two or more keyword-related phrases.

Fukumochi discloses a keyword-related phrase presentation step in which if, in the sentence pair extraction step, two or more sentence pairs are extracted for a keyword input in the input step and if two or more different keyword-related phrases in the source language are detected from the ambiguity then the detected two or more keyword-related phrases in the source language are presented to a user such that the user is allowed to select a keyword-related phrase from the presented two or more keyword-related phrases (**See claim 2**).

It would have been obvious to one of ordinary skill in the art at the time of the invention to modify the invention of Wakita, Appleby, and Chan by including a keyword-

Art Unit: 2626

related phrase presentation step in which if, in the sentence pair extraction step, two or more sentence pairs are extracted for a keyword input in the input step and if two or more different keyword-related phrases in the source language are detected from the ambiguity then the detected two or more keyword-related phrases in the source language are presented to a user such that the user is allowed to select a keyword-related phrase from the presented two or more keyword-related phrases for reasons similar to those of claim 2.

Wakita, Appleby, Chan, and Fukumochi do not specifically mention a co-occurrence word extraction step in which one or more co-occurrence words which co-occur with the keyword in the sentence pair are extracted and the extracted one or more co-occurrence words are described in a co-occurrence word table.

Sata discloses a co-occurrence word extraction step in which one or more co-occurrence words which are extracted (**Abstract, lines 1-5**) and the extracted one or more co-occurrence words are described in a co-occurrence word table (**Abstract lines 4-5, Fig 8**).

It would have been obvious to one of ordinary skill in the art to modify the invention of Wakita, Appleby, Chan, and Fukumochi by including a co-occurrence word extraction step as taught by Sata and using the keyword related presentation step disclosed by Fukumochi to present co-occurrence words for selection such that co-occurrence words are presented to a user such that the user can select one or more co-occurrence word from the co-occurrence words described in the co-occurrence word table in order to avoid a word of the highest frequency of use being simply adopted as

its equivalent in the second language even when there are a plurality of equivalents in the second language, making the translation meaningless or unnatural, as suggested by Sata (**Col 1 lines 40-45**).

Wakita, Appleby, Fukumochi, Chan, and Sata do not specifically mention that if one or more co-occurrence words are selected by the user, the selected one or more co-occurrence words are input as new keywords in the input step, and the text sentence candidate generation step is performed after completion of inputting all keywords, but one skilled in the art at the time of the invention would have known to input the selected words as new keywords since the user is selecting them in the context of entering a word or phrase for translation, and including them would avoid the risks of meaningless or unnatural translations discussed above.

Claim 15 simply combines the salient features of claims 3 and 6, and so is rejected for reasons similar to those of claims 3 and 6.

Claim 16 simply combines the salient features of claims 3 and 7, and so is rejected for reasons similar to those of claims 3 and 7.

Claim 17 simply combines the salient features of claims 10 and 13, and so is rejected for reasons similar to those of claims 10 and 13.

Claim 18 simply combines the salient features of claims 10 and 14, and so is rejected for reasons similar to those of claims 10 and 14.

***Conclusion***

9. A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

10. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Jesse Pullias whose telephone number is 571/270-5135. The examiner can normally be reached on M-F 9:00 AM - 4:30 PM. If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, David Hudspeth can be reached on 571/272-7843. The fax phone number for the organization where this application or proceeding is assigned is 571/270-6135.

11. Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
